DISMANTLING INSTRUCTIONS

Study the following nomenclature chart before removing any unit of the machine. Familiarize yourself with the names and locations of the various units and parts which are mentioned in the dismantling instructions.

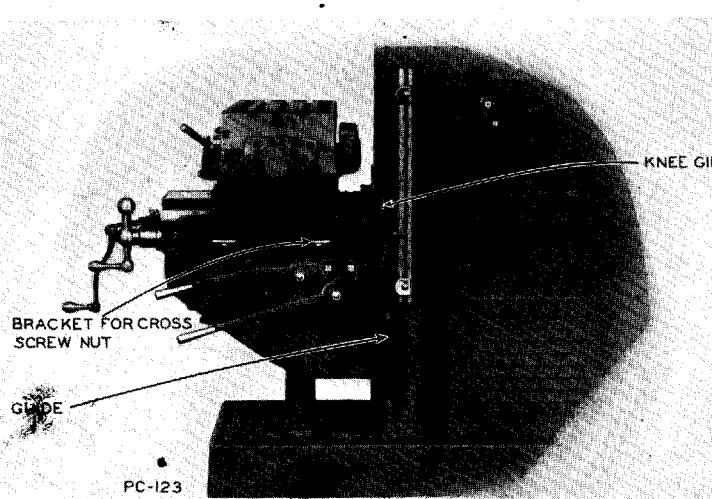

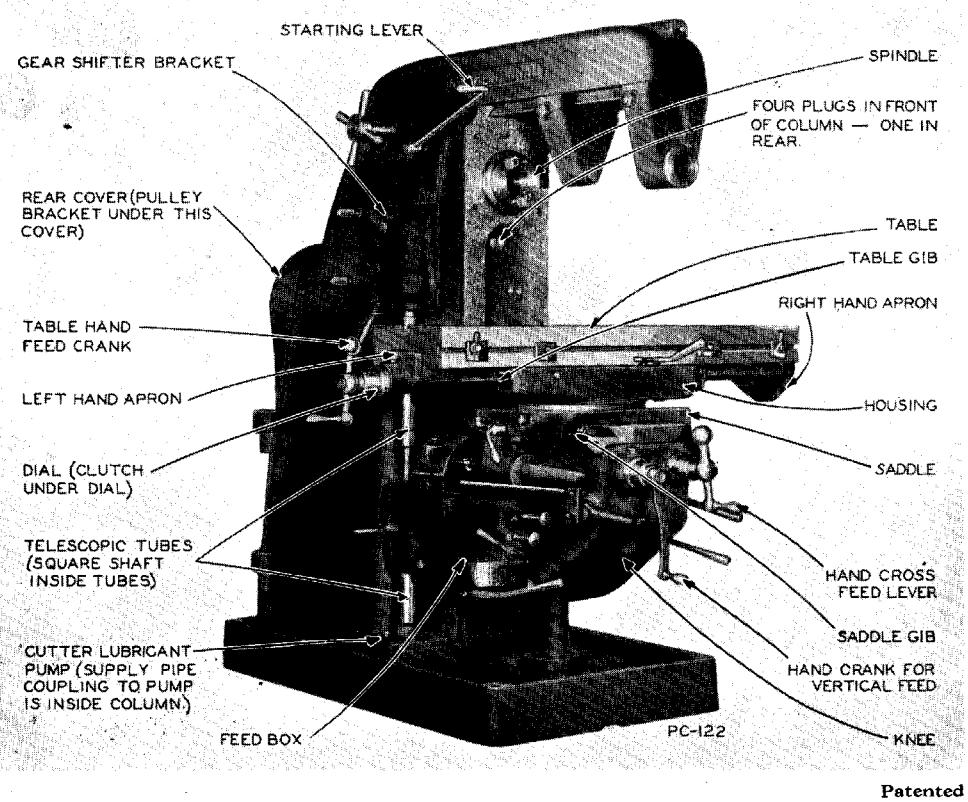

Fig. 1
M-Type Miller with 3-Way Power Rapid Traverse.

Removing the Table and Lead Screw

It is not absolutely necessary to remove the table when replacing the lead screw, but it is always advisable to do so, in order that the lead screw nut and other parts may be examined.

1. Remove the table hand feed crank and dial at the left-hand end of the table.
2. Knock out the taper pin in the clutch, remove the clutch and apron on the left-hand end of the table.
3. Remove the four fillister head screws from the apron on the right-hand end of the table.
4. Remove the table gib.
5. Push the overarm back to the face of the column, support the table in some manner from above or below, and slide it off the housing from right to left.
6. Run the lead screw through the lead screw nut from left to right, being careful to support the overhanging end to avoid springing.

Removing the Housing (Universal Only)

1. Remove the table and lead screw.
2. Remove the three $\frac{5}{8}$ hex head screws from the saddle; two on the left-hand side and one on the right-hand side.
3. Lift the housing straight up.

Removing the Saddle and Cross Screw

1. Remove the table and lead screw.
2. If the machine is universal, remove the housing.
3. Unscrew the lock nut from the cross screw. (This nut is located directly behind the front wall of the knee, as shown in Fig. 2.)
4. Remove the cross screw by turning the hand cross feed lever in a clockwise direction.
5. Remove the bracket for the cross screw nut. (The two $\frac{1}{2}$ " Allen head screws which hold this bracket in position are located in the slot for the cross feed dog.)
6. Remove the saddle gib.
7. The saddle may then be slid off the knee.

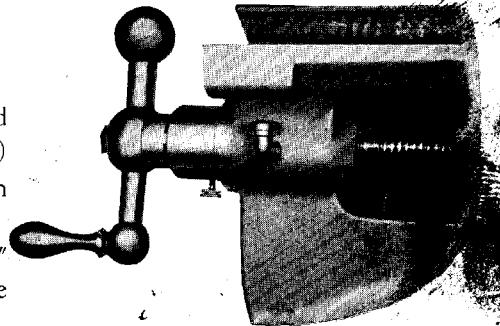

Fig. 2
View Showing Cross Screw Lock Nut Behind Front Wall of Knee.

Removing the Feed Box

1. Remove screw "A" in the boss on top of the gear shifter bracket. (Fig. 3.)
2. Remove lock spring "B" under the screw.
3. Unscrew the telescopic tube above and below the feed box. The upper part unscrews from the feed box, while the lower part unscrews from the pump.
4. Remove the square shaft by pulling it up through the feed box and gear shifter bracket.
5. Remove the three hex head screws from the feed box, and pull the unit straight out.

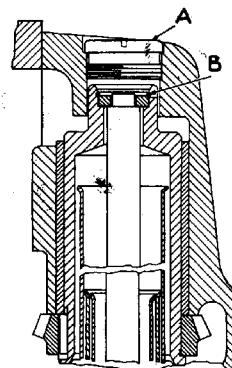

Fig. 3
Section Through Gear Shifter Bracket and Vertical Feed Shaft

Removing the Gear Shifter Bracket

1. {
2. } Same as 1, 2, 3 and 4 for "Removing the Feed Box".
3. }
4. }
5. Remove the eight fillister head set screws in the gear shifter bracket and pull the unit straight out.

Removing the Table and Lead Screw

It is not absolutely necessary to remove the table when replacing the lead screw, but it is always advisable to do so, in order that the lead screw nut and other parts may be examined.

1. Remove the table hand feed crank and dial at the left-hand end of the table.
2. Knock out the taper pin in the clutch, remove the clutch and apron on the left-hand end of the table.
3. Remove the four fillister head screws from the apron on the right-hand end of the table.
4. Remove the table gib.
5. Push the overarm back to the face of the column, support the table in some manner from above or below, and slide it off the housing from right to left.
6. Run the lead screw through the lead screw nut from left to right, being careful to support the overhanging end to avoid springing.

Removing the Housing (Universal Only)

1. Remove the table and lead screw.
2. Remove the three $\frac{5}{8}$ hex head screws from the saddle; two on the left-hand side and one on the right-hand side.
3. Lift the housing straight up.

Removing the Saddle and Cross Screw

1. Remove the table and lead screw.
2. If the machine is universal, remove the housing.
3. Unscrew the lock nut from the cross screw. (This nut is located directly behind the front wall of the knee, as shown in Fig. 2.)
4. Remove the cross screw by turning the hand cross feed lever in a clockwise direction.
5. Remove the bracket for the cross screw nut. (The two $\frac{1}{2}$ " Allen head screws which hold this bracket in position are located in the slot for the cross feed dog.)
6. Remove the saddle gib.
7. The saddle may then be slid off the knee.

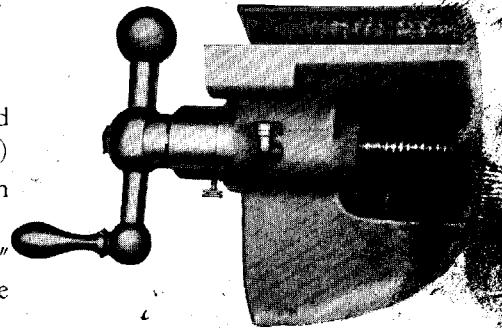

Fig. 2
View Showing Cross Screw Lock Nut Behind Front Wall of Knee.

Removing the Feed Box

1. Remove screw "A" in the boss on top of the gear shifter bracket. (Fig. 3.)
2. Remove lock spring "B" under the screw.
3. Unscrew the telescopic tube above and below the feed box. The upper part unscrews from the feed box, while the lower part unscrews from the pump.
4. Remove the square shaft by pulling it up through the feed box and gear shifter bracket.
5. Remove the three hex head screws from the feed box, and pull the unit straight out.

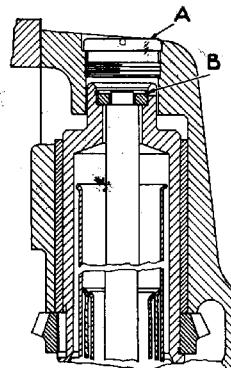

Fig. 3
Section Through Gear Shifter Bracket and Vertical Feed Shaft

Removing the Gear Shifter Bracket

1. }
2. } Same as 1, 2, 3 and 4 for "Removing the Feed Box".
3. }
4. }
5. Remove the eight fillister head set screws in the gear shifter bracket and pull the unit straight out.

Removing the Cutter Lubricant Pump

- 1.
2. Same as 1, 2, 3 and 4 for "Removing the Feed Box".
- 3.
- 4.
5. Unfasten the pipe coupling directly behind the pump inside the column.
6. Remove the two hex head screws in the pump flange and lift the unit straight up.

Removing the Knee

1. Remove the table, saddle, housing, and feed box as explained on page 3.
2. Remove circular plate "A" on top of the knee. (Fig. 4.)
(Tap the plate lightly to break the shellac seal and then pry it loose.)
3. Remove dog point set screw "B" from the lock nut "C" under the plate.
4. Remove the lock nut by holding it in position with a face spanner wrench and turning the hand crank for vertical feed.
5. Take two "L" clamps with 45 degrees clamping surfaces and bolt them together across the dovetails of the knee. Place the bolt central with the outside edge of the circular plate bearing. Hook up to a crane.
6. Remove the gib screw and gib on the right-hand side between the knee and column.
7. Remove the four hex head screws and the guide forming the right-hand knee bearing to the column.
8. Lift the knee straight up until the back of the knee clears the top of the elevating screw.

Removing the Pulley or Chain Gear Bracket

1. Drain the oil from the column of the machine.
2. **Important**—Push up the starting lever as when starting the machine and leave it in that position until the pulley bracket is replaced.
3. Remove the rear cover, or open it up wide if it is on hinges.
4. **For Vertical Only**—Remove plunger pump "A". This pump is in a vertical position, directly below the pulley bracket.
5. Remove the five hex head screws in the pulley bracket flange and pull the unit straight out.

Removing the Pulley Shaft and Driving Clutch

1. Drain the oil from the machine and remove the pulley bracket as explained above.
2. Remove the gear shifter bracket as explained on page 3.
3. Reach through the opening made by removing the gear shifter bracket and remove the two cotter pins in the straight pin through the gear hub and shaft. (Fig. 7.)

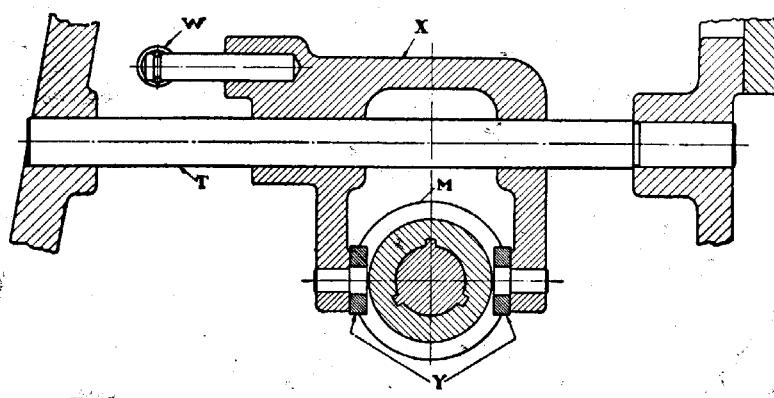

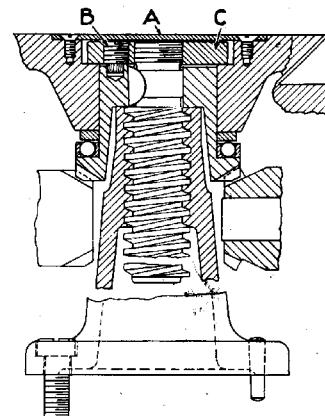

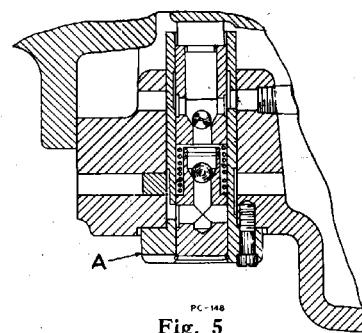

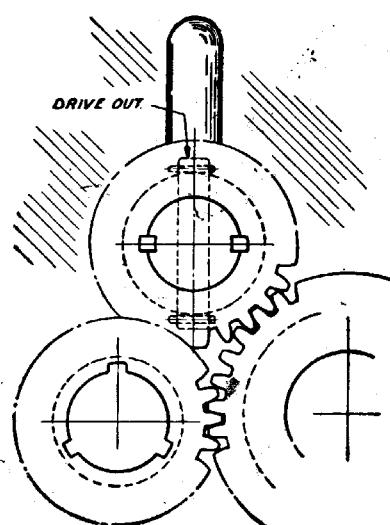

Fig. 6—Section Through Column Showing Clutch Shifter.

Fig. 4
Section through Vertical Screw.Fig. 5
Section through Plunger Pump on Vertical.Fig. 7
Section Through Column Showing Gearing Between Pulley Shaft and Drive Shafts.

4. Drive out the straight pin as shown, allowing it to fall to the bottom of the oil reservoir. (Note that there is only one position for driving this pin between the lower gears.)
5. Remove the wrench pan on the right-hand side of the column.
6. Drive the shifter shaft "T" (Fig. 6) through the column from left to right.
7. Remove spring "W" from the spring pin and wire or prop shifter "X" in a position so that shoes "Y-Y" are out of the slot in the spool "M". (Fig. 6.)
8. Pull the pulley shaft straight out.

If the clutch plates are to be renewed, they must be reassembled with a total of $\frac{1}{64}$ " clearance between them. This clearance can be controlled by means of the adjusting nut located at the end of the integral key section of the pulley shaft. Before replacing the pulley shaft and driving clutch in the machine, the ears on the clutch plates must be lined up and spool "M" moved forward, thereby engaging the clutch fingers and holding the clutch plates in position while the pulley bracket is being replaced.

Removing the Drive Shafts

1. Remove the tapped plugs in front of the column.
2. Remove the pulley bracket as explained on page 4.
3. Remove the gear shifter bracket.
4. Remove the pulley shaft and driving clutch if the **lower** driving shaft is to be removed. (Page 20) Otherwise it is not necessary.
5. Remove the lock washers and adjusting nuts from the rear end of the drive shafts.
6. Tap the shafts through their bearings from the front to the rear of the column. Collect the parts with the free hand as the shaft passes through its bearings.

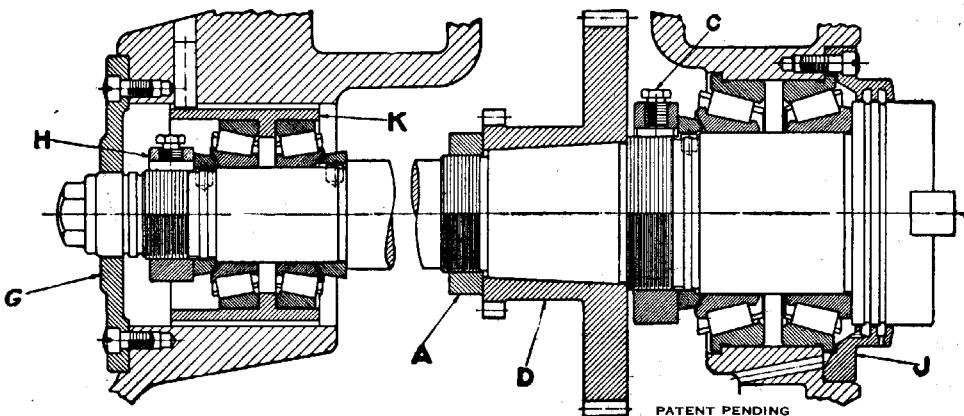

Fig. 8
Section Through Spindle of Horizontal Millers.

Removing the Spindle—Horizontal Machines (Fig. 8)

1. Remove the gear shifter bracket as explained on page 3.
2. Remove the tapped plug below the spindle in front of the column.
3. Remove the tapped plug below the spindle in the rear of the column.
4. Drive the back gear shaft through the column from the front to the rear.
5. Remove the cover on the right-hand side of the column.
6. Unscrew nut "A".
7. Remove the 1" pipe plug in the left-hand side of the column.

8. Loosen screw "C" in the locknut, tap the socket wrench to loosen the lock shoe, and with the wrench in position turn the spindle counter clockwise until the locknut backs up against the face gear.
9. Remove front spindle cap "J".
10. Remove rear cover "G".
11. Place a block between face gear "D" and the front of the column, and pound on the rear end of the spindle to loosen the face gear.
12. Unscrew locknut "H".
13. Reach through the opening made by removing the gear shifter bracket and drive out retainer "K" with a small rod.
14. Tap the spindle through its bearings from the rear end.

When replacing the spindle, first adjust the front bearings and then adjust the rear bearings for free running. Any further adjustment should be made on the front bearings only. (See "Operator's Instruction Book")

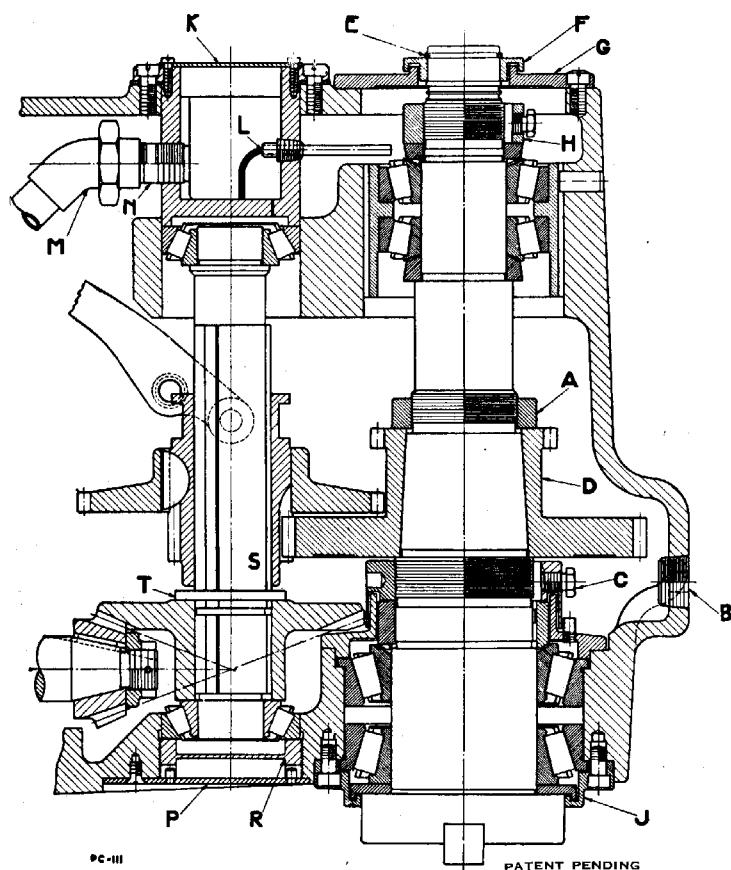

Fig. 9
Section Through Spindle of Vertical Miller.

Removing the Spindle—Vertical Machines (Fig. 9)

1. Remove the cover on the right-hand side of the column.
2. Remove the screw and the fork shaft which hold the back gear shifter fork in position. The back gear fork shaft may be driven out from the inside of the column through the opening on the right-hand side of the machine. Lift the fork out of the column.
3. Remove cover "K" on top of the oil reservoir.

Remove pipe plug "L" and the oil tube from the inside of the oil reservoir.

5. Reach through the opening in the right-hand side of the machine and disconnect union "M".
6. Remove nipple "N".
7. Disconnect the brass union in the $\frac{1}{4}$ " pipe to the oil reservoir, and also remove the short pipe.
8. Lift the oil reservoir out from the top of the column after removing the screws which hold it in place.
9. Remove rear cover "P" and retainer "R".
10. Set a rod against the lower end of back gear shaft "S" and pound it up about one-eighth of an inch.
11. Turn washer "T" until the slots register with the three keys on back gear shaft "S".
12. Continue pounding on the lower end of the shaft "S" until it is raised out of its bearings. Remove all loose parts.
13. Unscrew nut "A".
14. Remove plug "B".
15. Loosen screw "C", tap the socket wrench to loosen the lock shoe, and with the wrench in position turn the spindle counter clockwise until the locknut backs up against the face gear.
16. Remove spindle cap "J".
17. Remove lock spring "E".
18. Remove dust cap "F" and cover "G".
19. Place a block between face gear "D" and the column, and pound on the end of the spindle to loosen the gear.
20. Unscrew nut "H".
21. Tap the spindle through its bearings from the top. Block up under the flange to prevent injury to the spindle as it falls out of its bearings.

When replacing the spindle, first adjust the lower bearings and then adjust the upper bearings for free running. Any further adjustment should be made on the lower bearings only. (See "Operator's Instruction Book")

HOW TO ORDER REPAIR PARTS

You will receive quicker and better service when ordering your repair parts if you follow the instructions listed below.

Do not use this booklet when ordering parts for machines not included herein

If the order is by letter, the following information must be given:

1. Specify the amount required.
2. Give the part name of the part required.
3. Give the part number of the part.
4. Give the size and type of the machine for which the part is required.
5. Give the serial number and letters of the machine.

Example:

Please ship to us one Cap on Saddle 38146, for No. 1M Vertical, Serial E-472-C.

Signed.....

If the order is by telegram, the following information must be given:

1. Specify the amount wanted.
2. Give the part number of the part required.
- Give the code word for the size and type of the machine for which the part is required.
- Give the serial number and letters of the machine.

Example:

Ship one 34029 for EDKER, serial E-472-C.

Signed.....

You may find a factory identification number on the part which you are ordering. If you have a "Parts List and Service Repair Catalog" for the particular machine from which the broken part was taken, ignore this number completely. If you do not have a "Parts List and Service Repair Catalog" for the machine, the number stamped on the part, along with the amount required; the serial number and letters of the machine, and the size and type of the machine will be necessary in filling your order.

Number of parts are designated right or left. Right refers to the right-hand side of the machine from the normal operating position.

Unless the method of shipment is specifically stated in your order, we will ship by the quickest method and the shortest route.

CODE WORDS

For the Machines Included in this Booklet

	Belt Drive	Chain Motor Drive
1M Plain.....	EDONE	EDCHA
1M Universal.....	EDBUN	EDUMD
1M Vertical.....	EDEVE	EDKER

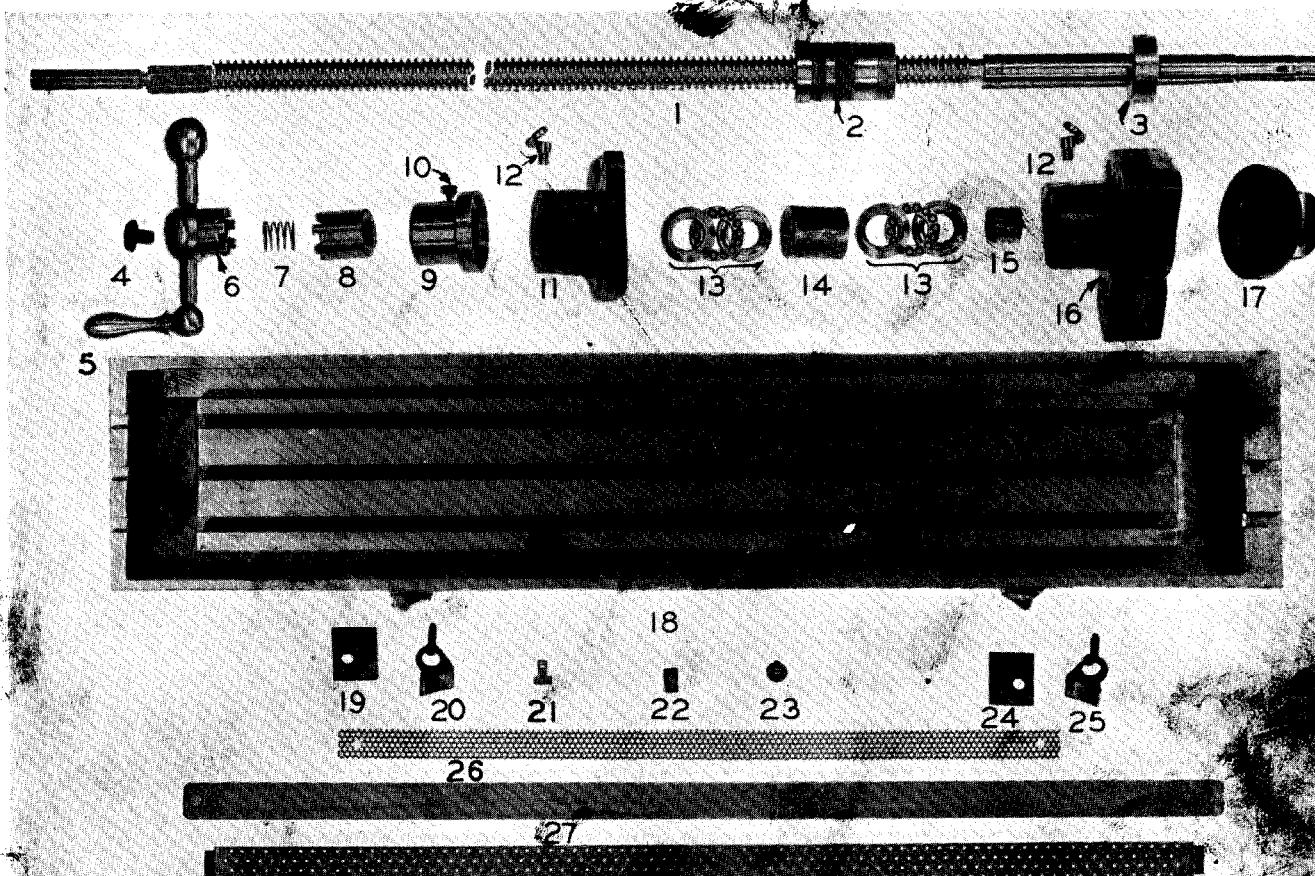

LOCATION OF MACHINE SERIAL NUMBER

The serial number and letters of the Horizontal machine are stamped on the column face directly under the spindle.

The serial number and letters of the Vertical machine are stamped on the column face at the top of the knee bearing.

*When telegraphing, give each digit separately of the part number and serial number.
i.e. 20507 Two-Naught-Five-Naught-Seven, rather than Twenty-Fifty-Seven, which may be written as 2057, causing us to ship the wrong part.

TABLE AND LEAD SCREW PARTS
